***Bracket, pole and end bungs powder coated white as standard.

Bannerfix

TRADE Price List - July 2008
Wall/Post Mounted Projecting Only

Technical Information:

This technical information has been produced to provide manufacturers and installers with essential information to ensure safe and secure banner installation. The information is for guidance only. No guarantee can be made on individual banner materials.

Banner Manufacture:

For exterior applications, always use reinforced, heavy duty/premier grade banner material. The banner should be stitch-seamed along the vertical edges on long drops and on the pockets which will receive the poles. It is also advisable to put grommets in the corners above and below the pockets.

To create pole pockets, use the following formula:
outside tube diameter (OD) of banner poles is 27mm, 4 x diameter of pole + 20mm).

This should provide a satisfactory fit.

Installation:

The **Bannerfix** post bracket is designed to be located on lamp columns of 76mm - 152mm diameter or similar vertical supports, by means of regular or heavy-duty stainless steel banding or tamtorques. (*Refer to SignPost banding guides for choice of sizes and grades*). Locate the band/tamtorque to sit in the formed recesses in the bracket.

It is important that a qualified engineer assesses the column's structural capability to withstand the additional wind-loading created by the installation of the banner assembly.

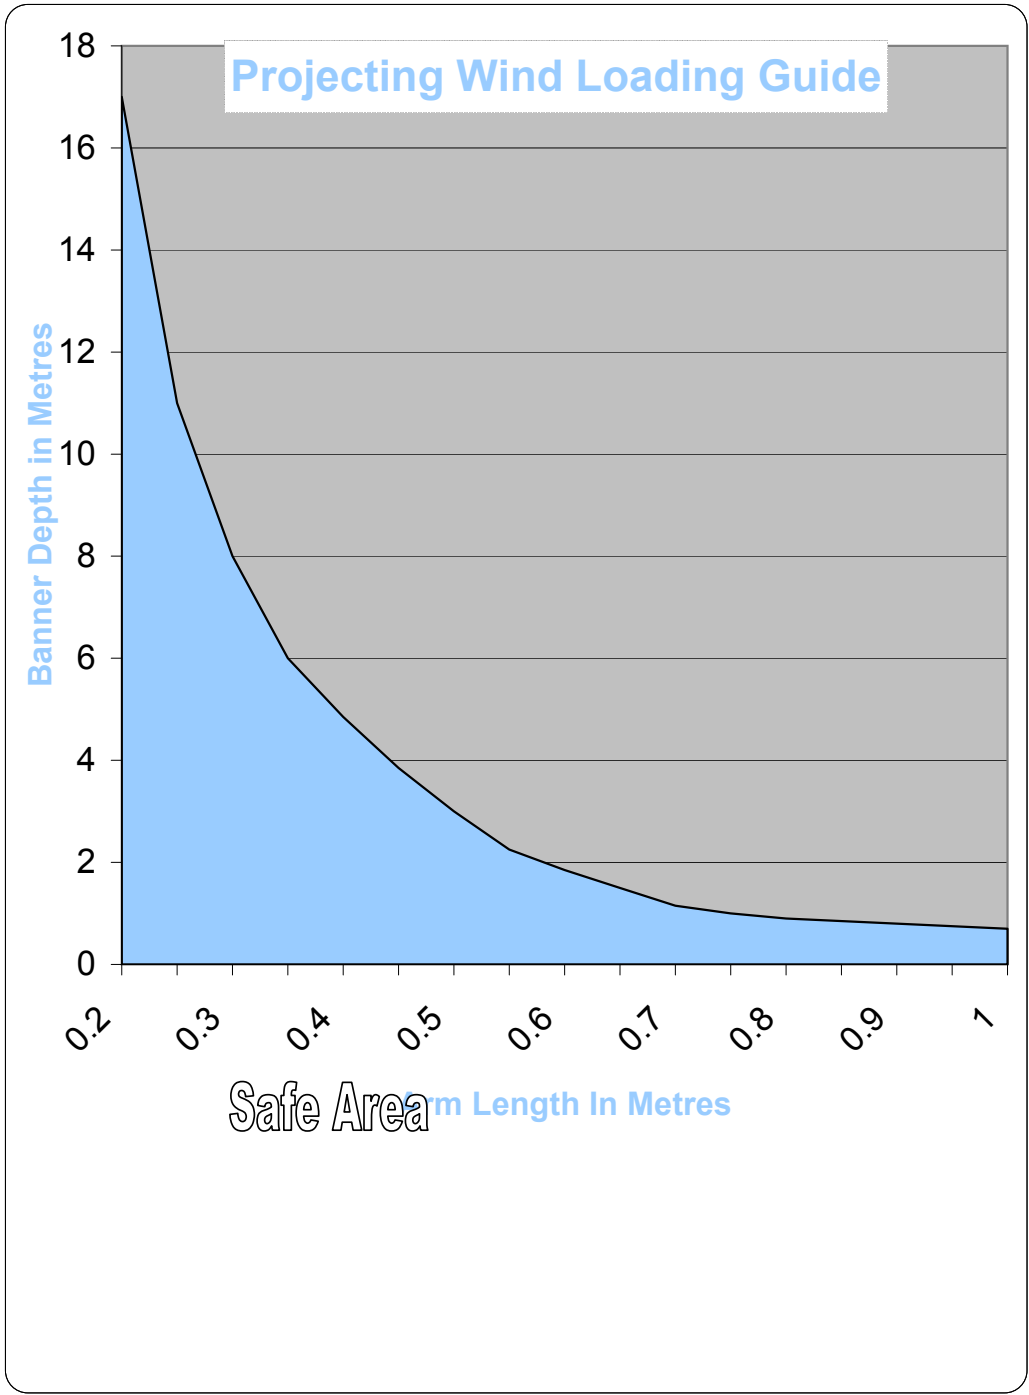

A flat bracket option is available for wall mounted banners. Each bracket is manufactured with 4 holes, designed to accept suitable M8 fixings. (Not supplied).

Wind-loading Guidelines:

The following chart indicates the maximum banner area the **Bannerfix** brackets can comfortably support and should not be exceeded.

Check the length of the projecting **Bannerfix** arm against the overall banner length and ensure that it falls within the safe area of the graph.
